Polycarbonate Case Having UL 94 V-0

OMEGA XMER square type CT's are housed in robust case with classical finish. The case is made of polycarbonate, which is flame retardant and non-drip and confirms to international regulations UL 94 V-0. Polycarbonate is a very tough and light weight engineering plastic material which has got the best mechanical properties very close to a metallic housing.

Main Types of XMER Series CT's

There are two main types of OMEGA XMER CT's. The first one is OMEGA XMER wound primary series CT's which consists of both primary and secondary windings. This type has two sizes 62/W (40) and 74/W (40).

The second type is OMEGA XMER series window type CT's which consists of secondary winding and primary has to be wound through the hole provided. This type has many sizes according to standard bus-bar sizes.

Some Important Terms Used in XMER CT's

Current Error (Ratio Error):- The error with a transformer introduces into the measurement of current and which arises from the fact that actual transformation ratio is not equal to the rated transformation ratio.

Phase Displacement:- The difference in phase between the primary and secondary current vectors, the direction of the vectors being so chosen that the angle is zero for the perfect transformer. The phase displacement is said to be positive when the secondary current vector leads the primary current vector. It is usually expressed in minutes.

Composite Error :- Composite error is the resulting limitation of the harmonic content of the secondary current which is necessary for the correct operation of certain types of relays.

Accuracy Class:- A designation assigned to a current transformer the errors of which remain within specified limit under prescribed conditions of use.

Rated Burden:- The impedance of the secondary circuit on which the accuracy requirements are based. It is usually expressed as apparent power (in VA), at the rated secondary current and at a specified power factor.

Rated Output:- The value of the apparent power (in volt-amperes at a specified power factor) which the current transformer is intended to supply to the secondary circuit at the rated secondary current and with rated burden connected to it.

Highest System Voltage:- The highest rms line to line voltage which can be sustained under normal operating conditions at any time and at any point on the system. It excludes temporary voltage variations due to fault condition and the sudden disconnection of large loads.

Rated Insulation Level:- That combination of voltage values (power frequency and lightning impulse, or where applicable, lightning and switching impulse) which characterizes the insulation of a transformer with regard to its capability to withstand by dielectric stresses. For low voltage transformer the test voltage 4kV, at power-frequency, applied during 1 minute.

Rated Short Time Thermal Current (I_{th}):- The RMS value of the primary current which the current transformer will withstand for a rated time, with their secondary winding short circuits without suffering harmful effects.

Rated Dynamic Current (I_{dyn}):- The peak value of the primary current which a current transformer will withstand, without being damaged electrically for mechanically by the resulting electromagnetic forces, the secondary winding being short-circuited.

Rated Continuous Thermal Current:- The value of current which can be permitted to flow continuously in the primary winding, the secondary windings being connected to the rated burdens, without the temperature rise exceeding the specified values.

Instrument Security Factor (ISF):- The ratio of rated instrument limit primary current to the rated primary current. The times that the primary current must be higher than the rated value, for the composite error of a measuring current transformer to be equal to or greater than 10%, the secondary burden being equal to the rated burden. The lower this number is, the more protected the connected instrument are against.

Clamp Meters

The Delta series consist of clamp meters and clamp CT's. This meter is basically used where the electric current in the conductor can be measured, without having to make physical contact with it. The meter has wide opening jaws with 180° rotational movement which makes it comfortable for the user to handle it during the measurement. By using clamp CT's, we can measure the electrical parameters above the normal range by use of normal digital multimeters easily.

Features

- Basic accuracy 0.25 %, high accuracy low current measurement
- Large jaw opening with 180° rotation to avoid difficult measuring positions
- Narrow housing for firm grip and easy to carry
- Null zero correction for low current measurement
- Analogue scale and auto power off
- Safety in accordance with IEC 61010-1
- Minimum transformation ratio error
- Compact, handy design
- Permanently connected safety cables

Delta 1000

Features

- Delta 1000A is a highly innovative design for features those increases safety and comfort of user
- Rotating clamp jaws facilitate the measurement at physically awkward positions, vertical bus bars, conductors placed at positions difficult to access
- Location and design of trigger eliminates fatigues caused by single finger operation
- It allows spreading the force required to open the jaws over more than one finger to ensure comfortable operation
- Clamp jaws can be opened or closed with the trigger placed at bottom side away from the jaws
This allows the user to place his/her hand at safer distance from live conductor. This greatly reduces exposure of human beings to electrical shocks

Test Voltages to 5000V

This instrument is suited for the non-destructive measurement of insulation resistance in electrical systems, at machines and transformers and in cables, as well as within the electrical equipment of, for example, locomotives, tram systems and ocean going vessels, with eight selectable test voltages up to 5kV.

Voltage Measurement to 2000V

With the voltage measuring ranges, test objects can be checked for the absence of voltage in networks of up to 2kV. This is important for insulation resistance measurement, because extraneous voltages distort measurement results.

Discharge of Capacitive Devices under Test

Capacitive devices under test such as cables and coils, which might be discharged to test voltage, are discharged by the measuring instrument. The drop in voltage can be observed at the needle gauge.

Measurement in accordance with EN61557 part 1 and 2/ IS 2992 (VDE 0413).

Measuring current is equal to 1mA at a test voltage of 100V, 250V, 500V and 1000V.

Measurement Cables with Heavy-Duty Insulation

The measurement cables with heavy-duty insulation are permanently connected for safety and technical reasons. Possible danger caused by the unintentional removal of cables is thus avoided, for example when charging occurs due to capacitive test objects.

Needle Gauge with LEDs

Three LEDs arranged within the needle gauge make reading easier. The lamp lights up which is located next to the scale, which is assigned to the selected measuring range. During the measurement sequence, the green LED indicates whether or not the battery charge is sufficient for the measurement.
